

Rehab Stratford

Rehab Stratford - EECP therapy is a relatively new outpatient treatment used for heart failure and angina. People with heart ailments may find the simple every day activities somewhat tough. Activities such as walking the dog or getting the mail can present some difficulties. If you or perhaps somebody you know experiences heart failure or angina, the non-invasive treatment known as EECP therapy can prove helpful. Statistics show that roughly 80% of patients who complete the 35 hour course of EECP therapy report substantial symptom relief that could last up to 3 years.

EECP therapy has shown to be a useful treatment utilized for angina and heart failure. Normally, treatments are given for an hour a day, 5 days a week for a total of 35 hours. A treatment session comprises lying on a comfortable treatment table with big blood pressure like cuffs wrapped all-around your legs and your buttocks. At certain times in between your heartbeats, these cuffs inflate and deflated. A continuous ECG or electro cardiogram is utilized in order to set the timing. This insures that the cuffs inflate while the heart is in its resting condition where it normally receives its supply of blood and oxygen. Afterward the cuffs deflate at the end of that rest period, just prior to the next heartbeat. The person wears a special sensor on their finger to monitor the levels of oxygen in their blood. The sensor also monitors the pressure waves created by the cuff inflations and deflations.
