

Acupuncturist in Stratford

Acupuncturist in Stratford - IV therapy or likewise known as Intravenous therapy is the placing of substances directly into a vein. IV therapy has been utilized to be able to correct electrolyte imbalances and to be able to deliver medications in blood transfusions. It can also be utilized as fluid replacement so as to correct, like for instance, dehydration. The intravenous route is the fastest way to deliver medications and fluids all over the body. Various medications, in addition to lethal injections and blood transfusions, could only be given intravenously.

Vitamin C Intravenous therapy is an alternative treatment for illnesses like cancer. A lot of centers dedicate certain treatment regimens, even though there is still some controversy around this particular form of treatment. Amongst the reputed benefits of Vitamin C therapy comprise: prolonging survival and increasing the quality of life. Vitamin C is effective in preventing systemic free radical injury and corrects an ascorbate deficiency, that is usually found in cancer patients. Vitamin C inhibits hyaluronidase. This is actually an enzyme made by cancer cells which is responsible for the breakdown of healthy tissue, resulting in metastasis and tumor progression. Vitamin C also works synergistically conventional with other traditional cancer treatments.

Vitamin C, also referred to as L-ascorbic acid or L-ascorbate is a really essential nutrient for humans and many different animals. It acts as an antioxidant and protects the body against oxidative stress. Vitamin C is also a co-factor in at least 8 enzymatic reactions including various collagen synthesis reactions that result in the most severe indications of scurvy when they are not working correctly. In animals, these enzyme reactions are extremely vital in preventing bleeding from wound-healing and capillaries.

Vitamin C Mega Dosage

There are a lot who really endorse and advocate making use of Vitamin C, over 10 to 100 times more than the RDI or Recommended Daily Intake. Supplements of Vitamin C can be taken orally or by intravenous therapy. There have yet to be large, randomized clinical trials on the circumstances of high doses performed on the general population. Linus Pauling spent a large portion of his life advocating the use of mega doses of vitamin C. He believed the established RDA was adequate to prevent scurvy but not necessarily a high enough dosage for optimal health.

Mega doses of vitamin C have been used in the prevention and treatment of different sicknesses consisting of the common cold, cancer and coronary disease. Current RDI for vitamin C is 60 mg however, several references quote a minimum of 30 mg and others state we should have at least 100 mg on a daily basis. People taking a mega dose can ingest anywhere from 500mg to 1000 mg on a daily basis but the side effect of diarrhoea can be a common problem for individuals who ingest large amounts.
